Do not be mislead by vacuums claiming to provide clean air quality with HEPA filters that are undersized and untested. These filters often leak or bypass dangerous particles in the air. HEPAPro vacuums are equipped with oversized HEPA filters that are individually tested to be 99.97% efficient at .3 microns. The proof is the test data is on a label affixed to the filter. If you do not see a test label with numbers (airflow, penetration rate & serial number) on your HEPA filter, you do not have a genuine HEPA filter. Our HEPA filters are also designed to be “Fail Safe”. If for any reason, the HEPA filter is not installed correctly, the vacuum will fail to pick-up, preventing an unintentional leak or exposure of dust. Most vacuums claiming to be HEPA, have factory installed filters that are permanently mounted and not “Fail Safe”. There is no guarantee that the filter is installed correctly to eliminate the possibility of leaks or bypass.
